ScienceHub — Locked Refinement

Final locked design, architecture and navigation specification

1. Product Identity

ScienceHub is a personal-use-only Study OS. Class 11 is the primary academic focus; Class 12 is integrated where topics overlap or extend Class 11. The product is mobile-first, privacy-focused, local-first and prepared for PWA/offline use and later Android packaging.

2. Home Page V2

Home uses a warm personal study atmosphere plus stronger ScienceHub branding and a clear mission-first hierarchy. It includes: branding/header; live genetic double-helix core; revolving “e” on a designed path; Today’s Mission; Global Search; Quick Actions; Study Dashboard; Continue Learning; Subjects; Study Engine; Practice/PYQ; Strong/Weak; Revision; Planner; Exam Tracker; AI Study Assist; Future Possibilities; and PCB Opportunities as the final major section.

3. Live Science Core

The former brain visual is replaced by a functional animated genetic double helix. The “e” revolves on a designed path. It should support interaction, pause/resume and reduced-motion behavior while remaining mobile-friendly.

4. Bottom Navigation — LOCKED

Persistent app-wide navigation: ← Back | ■ Home | ■ Study | ■ Notes | ■ Progress | ■ More. Back/Reverse means previous-screen navigation, not undo. If there is no previous screen, it returns to Home and coordinates with Android/browser back behavior.

5. Study

Study contains Subjects, Syllabus, Latest Syllabus, Practice, PYQ and Revision. Core flow: Learn → Practice → Test → Analyse → Revise → Master. Subjects: Biology, Physics, Chemistry, English and Hindi.

6. Latest Syllabus — LOCKED

Syllabus → Latest Syllabus must contain the complete UP Board (UPMSP) syllabus for Class 11 and Class 12, not only PCB. It must support Hindi and English, organized as Subject → Unit/Chapter → Topic, with current-version/update tracking and personal syllabus progress.

7. PCB Sticker — LOCKED

PCB Sticker is a reusable visual identity plus an AI-readable structured knowledge layer. It appears contextually in relevant Syllabus and Notes content and may mark relevant careers, courses, research, bioinformatics, scholarships, entrance exams and opportunities without cluttering unrelated screens.

8. PCB Sticker Metadata

AI-readable fields include PCB relevance, subject connection, class, chapter/topic, syllabus status, note relationship, PYQ/practice relationship, revision relevance, career/course connection, bioinformatics connection, scholarship/exam relevance, and importance/status tags. Architecture: PCB Sticker → structured metadata → AI context → Syllabus/Notes/Practice → pathways/opportunities.

9. PCB Stream — LOCKED

PCB Stream is NOT a subject section. It is a future-pathway/opportunity hub covering Career Paths, Courses & Degrees, Research, Bioinformatics, Career Opportunities, Scholarships, Entrance Exams, Future Opportunities and AI Guidance.

10. Notes

Notes contains Personal Notes, AI Notes, subject/topic notes and focused search. PCB Sticker integration is contextual. Native device sharing should share only the selected item and respect privacy controls.

11. Progress & Assessment

Progress connects study time, sessions, performance, strong/weak topics, revision status and exam performance. Locked scoring: good performance = +2; bad performance = -1. PYQs start from 2020 onward and can be tagged by exam name, competitive status and over-syllabus status.

12. Exam Tracker

Exam tracking distinguishes “Exam went with trouble” and “Exam goes smoothly”. It connects with planning and performance analysis.

13. More

More contains Planner, Exam Tracker, PCB Stream, AI roles, Future Possibilities, My Space, Settings and Recovery. Recovery remains the last My Space option.

14. AI Roles

KuroVen = default action-taker/action-starting assistant. Hikaitage = learning + strategic problem handling, where/what/how/why/when, 30+ years teaching-style. HukoVaige = psychology/behavior analysis, curiosity/patterns, growth mindset and honest reality assessment, 45+ years psychologist-style. Aui/WORLD AI = callable world-information function, not a permanent main role.

15. Architecture

Use a modular local-first PWA architecture: HTML/CSS/JS, IndexedDB and Service Worker. Suggested modules: core, subjects, notes, planner, quiz, PYQ, analytics and AI. Home reads shared module data rather than duplicating it. Core Study OS should remain usable if an AI/API layer is unavailable.

16. Data, Privacy & Sharing

Support detailed study-time tracking, user-data separation, privacy controls and native device Share. Sharing must never unintentionally expose private data. Camera mode and other locked settings remain part of Settings.

17. Overall Connected Flow

Home → Study → Subjects/Syllabus/Practice/PYQ/Revision → Notes → Progress → More → Planner/Exams/PCB Stream/AI/My Space/Settings/Recovery. All modules are connected through shared data and persistent navigation.

STATUS: LOCKED REFINEMENT — Use this specification as the baseline for further ScienceHub implementation and GitHub updates.
